INTERACTIVE STUDENT PROTOTYPE

Sustain *Style*

UX DESIGN JOURNAL

FA-2 — Design. Build. Validate.

THE SUSTAINSTYLE PROTOTYPE · BUILT IN FIGMA

STUDENT	CLASS / GRADE	ACADEMIC YEAR	PROTOTYPE
[INSERT NAME]	*[INSERT CLASS]*	*[INSERT YEAR]*	scale-bot-20097225 .figma.site

PROJECT OVERVIEW

A quieter way to choose clothes.

SustainStyle is a mobile application concept that helps people understand the environmental story behind a piece of clothing before they decide to buy it, wear it again, or let it go.

The idea is simple. Most of us stand in a shop, or scroll through an online store, with very little information about what a garment is actually made of, how long it might last, or whether there is a better option already sitting in our wardrobe. Labels are small, technical and easy to ignore. SustainStyle places that information in one calm, readable place and turns it into a decision the user can actually act on.

The prototype follows a single, deliberate journey: **scan a garment tag, read an illustrative Eco-Score, explore kinder alternatives, and collect GreenPoints for thoughtful actions.** Everything is built around one sentence that appears on the home screen — *“Small choices, thoughtfully made.”*

The application does not attempt to police what people buy. Instead, it tries to make the consequences of a purchase visible at the exact moment a decision is being made, and then offers a realistic next step rather than a lecture.

THE INTENDED EXPERIENCE

Calm rather than urgent. Clear rather than clinical. The interface should feel closer to a well-edited magazine than a compliance tool — quiet colours, generous spacing, plain language, and one obvious action on every screen.

9	SAMPLE PIECES
4	DEMO SCAN CODES
3	RATING TIERS

PLATFORM	Mobile web prototype (390 px)
TOOL	Figma / Figma Make
PRIMARY USER	Young adult shopper
CORE LOOP	Scan → Score → Swap → Points

WHAT THIS DOCUMENT IS

A design journal, not a pitch. It records the screens that exist, the reasoning behind them, and the honest limits of a student prototype built in a single design cycle.

HOW IT WAS PRODUCED

The interface was built first in Figma Make, then explored screen by screen. Colours and type were read from the live stylesheet so the documentation matches the product exactly.

WHAT IS NOT CLAIMED

No real environmental dataset, user-testing result or commercial partnership is implied. Every simulated value is labelled as such throughout the interface and this journal.

THE PROBLEM

The information exists. It just isn't *usable*.

Sustainable fashion is not short of data. It is short of translation. The gap SustainStyle addresses is not a lack of information, but a lack of information that a normal shopper can find, understand and use in the few seconds before a purchase.

01

Impact is invisible at the point of decision

A garment's fibre, production and expected lifespan are rarely visible when someone is choosing between two similar shirts. The environmental cost is real but abstract, and abstraction rarely changes behaviour.

02

Sustainability language is hard to read

Terms such as "circular", "organic" and "carbon neutral" are used loosely and inconsistently. Users without a technical background cannot easily judge which claim matters, or how two products compare.

03

Greener alternatives are not surfaced

Even a motivated shopper has to research separately to find a second-hand version, a repair option, or a better-made equivalent. That effort is usually enough to stop the intention turning into an action.

04

Responsible choices feel like sacrifice

Sustainable messaging is often guilt-led. If the experience feels like a reprimand, users disengage. SustainStyle reframes the same choices as care, longevity and quiet reward.

PROJECT OBJECTIVES

OBJECTIVE 01

Make impact readable in seconds

Convert material data into a single, glanceable rating with a plain-language explanation.

OBJECTIVE 02

Reduce the effort of choosing better

Place repair, resale and longevity options directly beside the product being evaluated.

OBJECTIVE 03

Reward care, not consumption

Use gentle gamification to make repairing, re-wearing and comparing feel worth doing.

OBJECTIVE 04

Stay honest about the data

Label every score as illustrative so the prototype never implies verified environmental accuracy.

> "The design challenge was not to add more information to shopping. It was to remove the effort of understanding it."

TARGET USERS & PERSONAS

Two people, one hesitation.

Both personas are **representative design personas** created to guide interface decisions. They are not interview participants, and no quotes or data have been attributed to real people.

AM

PERSONA 01

Amara, 21

University student · part-time retail

LIFESTYLE	Busy, social, budget-aware. Shops mostly online, often late at night.
SHOPPING HABITS	Buys 2–3 low-cost trend pieces a month; repeats outfits for class.
AWARENESS	Knows fast fashion is “bad” but cannot explain why, or compare items.
DEVICE	Phone-first, shops in short bursts

GOALS

- Look good without spending much
- Feel less guilty about the clothes she buys

FRUSTRATIONS

- Sustainability labels she cannot decode
- Advice that assumes a bigger budget

NEEDS FROM SUSTAINSTYLE

A fast, honest answer at the moment of browsing — and a cheaper alternative, not a lecture.

DL

PERSONA 02

Daniel, 34

Graphic designer · hybrid worker

LIFESTYLE	Design-literate, buys less but researches more. Values quality and repair.
SHOPPING HABITS	A few considered purchases a year; buys second-hand when he can.
AWARENESS	Fairly informed; sceptical of brand claims and vague green marketing.
DEVICE	Phone and desktop, comparison-heavy

GOALS

- Buy things that will last and age well
- Understand what a score is actually based on

FRUSTRATIONS

- Ratings with no visible reasoning
- Having to open five tabs to compare materials

NEEDS FROM SUSTAINSTYLE

Transparency about method, a materials breakdown, and a credible route to repair or resale.

◎

SHARED DESIGN IMPLICATION

Both users need the same three things: **a score they can read instantly, a reason they can trust, and an alternative they can act on.** These three needs became the spine of the interface.

USER JOURNEY & APP FLOW

From curiosity to a considered action.

The journey below reflects the actual navigation in the prototype. Each step is a real screen; each arrow is a real tap target. The loop is intentionally short, because the whole value of the product depends on fitting inside a shopping moment.

PRIMARY JOURNEY — SCANNING A GARMENT

01 **Home**
Greeting, sample pieces, scan entry

→

02 **Choose demo code**
Four sample tags

→

03 **Scanning**
Simulated tag read

→

04 **Eco-Score**
Rating + materials

→

05 **Alternatives**
Repair, resale, longevity

→

06 **GreenPoints**
Action logged, points added

ENTRY POINTS

SCAN AN ITEM	Primary call to action on Home
EVALUATE	On any of the nine sample pieces
ADD CLOTHING	Manual entry sheet on Home
BOTTOM NAVIGATION	Home · Swap · Points · Profile

EXPECTED OUTCOMES

- User understands why an item scored the way it did
- User sees at least one realistic lower-impact option
- User can record a thoughtful action in one tap
- User returns to a visible record of their progress

SECONDARY PATHS

A **Home → Filter → Evaluate**
Browse by category instead of scanning

→

B **Add clothing → Add & evaluate**
Manual material entry creates a sample score

→

C **Eco-Score → Why this score?**
Expandable reasoning panel

→

D **Points → Profile**
Badge shelf and preferences

Design note. The flow deliberately avoids a login, a search bar or a checkout. Every extra step between “I’m curious” and “I understand” would reduce the chance that the user completes the loop. The four-item bottom bar is the only persistent navigation, so the user is never more than one tap from Home.

INTERFACE DESIGN & RATIONALE

Quiet colour. Clear hierarchy.

Every value below was read directly from the live prototype's stylesheet, not estimated from a screenshot.

COLOUR PALETTE — ACTUAL INTERFACE TOKENS

Forest #214E3D	**Deep forest** #12372D	**Sage** #A8BFA5	**Ivory** #F7F4EC	**Mist grey** #E7E8E1
Terracotta #C77C59	**Amber** #E0A93B	**Signal red** #C8503F	**Charcoal** #252A27	

Forest and deep forest carry structure and trust; ivory keeps long reading screens comfortable; sage marks progress and secondary information; terracotta is reserved for demo labels and the single most important accent. Amber and red appear only inside the Eco-Score rating, so colour never loses its meaning.

TYPOGRAPHY — AS IMPLEMENTED

Playfair Display

Headings · 400 weight · −0.035 em tracking · 31 px base

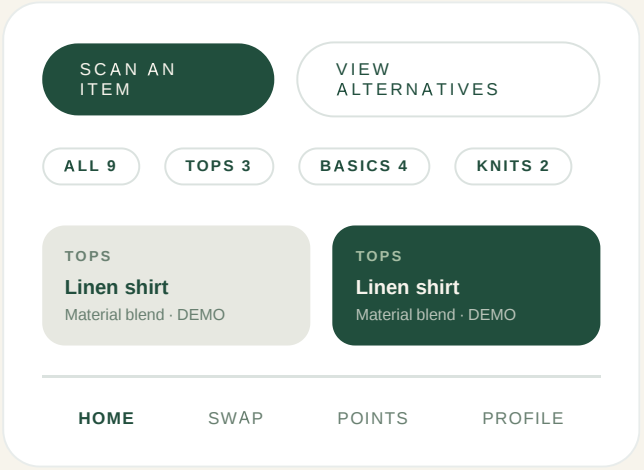

Inter — body and interface text

Body 300–600 · labels 700 · 9 px uppercase eyebrows at 0.18 em

SECTION LABEL · 0.2 EM TRACKING

The pairing does most of the brand work. Playfair Display gives the product an editorial, almost magazine-like confidence, which separates it from the utilitarian language of most sustainability apps. Inter keeps every functional element — scores, labels, buttons, navigation — neutral and highly legible at small sizes.

COMPONENTS & SPATIAL SYSTEM

Cards use 24–28 mm radii, the bottom bar sits 18 mm from the edges with a 23 mm radius and a soft blur, and the phone frame itself is 42 mm. The result is a set of soft, nested containers that feel tactile without becoming playful. A 4 mm spacing base keeps rhythm consistent across every screen.

Why green, and why not bright green

A saturated "eco green" reads as a badge rather than a brand. Forest green is darker and more neutral, so it can carry large areas of the interface without feeling like a warning label. It also holds contrast against ivory at body-text sizes.

Why one accent, used sparingly

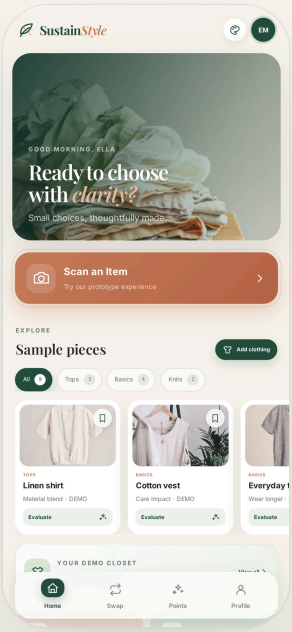

Terracotta appears only on demo labels, eyebrows and key highlights. Because it is rare, it directs attention reliably. Using it for every button would flatten the hierarchy and make the interface feel louder than the message.

Why the score is colour-coded

Green, amber and red are the only places where conventional signal colours appear. Users already understand a traffic light, so the rating can be read before the number is even processed — an important advantage on a small screen.

APPLICATION SCREENS · 01–02

Home & scan entry

01 HOME / DASHBOARD

Home

LIVE INTERACTION · DEMO DATA

Purpose. Give the user a single starting point and make the primary action impossible to miss. The screen also previews the sample wardrobe so the prototype can be explored without scanning anything.

MAIN COMPONENTS

Greeting header with initials avatar; 280 px hero; primary “Scan an Item” button; “Add clothing” control; category filter chips; nine garment cards; closet summary; alternatives card; GreenPoints card; “Today’s Edit” story; four-item bottom bar.

INTERACTIONS

Scan opens the demo code screen. Chips filter the grid (All 9 / Tops 3 / Basics 4 / Knits 2). “Evaluate” opens the Eco-Score. Cards and the story tile navigate to Swap. Points card opens the dashboard.

USER ACTIONS

Scan, browse, filter, evaluate, or open a section from the bottom bar.

CONTRIBUTION

Establishes the tone — calm, editorial, non-judgemental — and offers three entry points so no user is forced into the scanner.

02 DEMO SCAN · CODE SELECTION

Choose a demo code

SIMULATED · 4 OUTCOMES

Purpose. Replace a real camera scan with a controlled, explainable simulation. The user chooses one of four sample garment tags, each producing a different rating outcome.

MAIN COMPONENTS

“Demo scan · simulated” label; heading; four selectable code cards with fibre type, garment name and fictional brand; single “Scan selected code” button; persistent disclaimer.

INTERACTIONS

Selecting a card highlights it. “Scan selected code” starts the simulated read. The disclaimer “Prototype simulation, not a live scan” stays visible.

USER ACTIONS

Choose a tag, then confirm the scan.

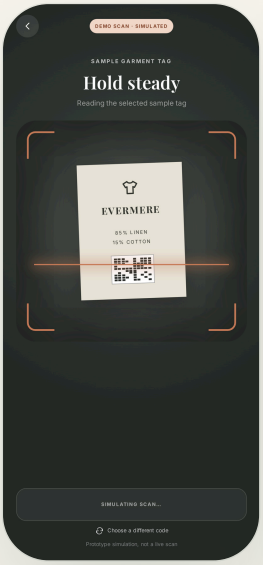

CONTRIBUTION

Makes the prototype testable by anyone, on any device, while being explicit that no real product data is being read.

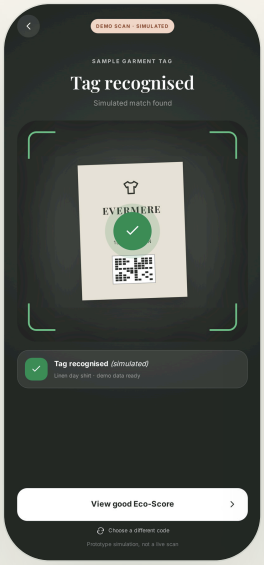

Honesty by design. The word “demo” is not hidden in a settings menu. It appears in the section label, on each card and in the footer of the screen. This was a deliberate decision: a sustainability tool that overstates its own accuracy would undermine the exact trust it depends on.

APPLICATION SCREENS · 03–06

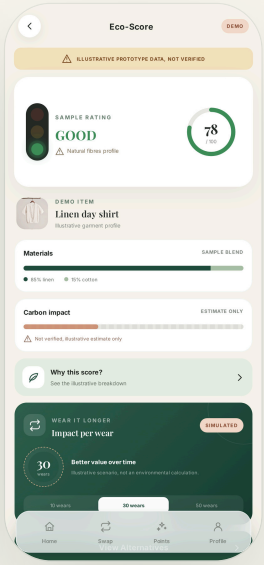

The scan moment & the score

03 SCANNING

04 TAG RECOGNISED

05 ECO-SCORE · GOOD

Hold steady

A short, believable pause. The screen shows the tag being read — brand, fibre composition — and a progress state reading “Simulating scan…”.

INTERACTION

Automatic transition after roughly three seconds. “Choose a different code” remains available as an escape route.

Match found

Confirmation that the sample tag has been matched. The button changes wording with the result: “View good Eco-Score” for linen, “View moderate” for the blend, “View limited” for polyester.

INTERACTION

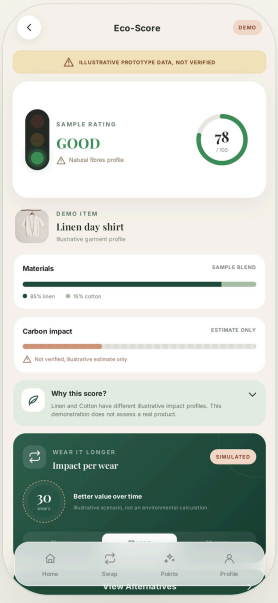

Primary button opens the Eco-Score. Secondary link returns to code selection.

78 / 100

The rating is the loudest element on the screen, followed immediately by the materials that produced it. “Wear it longer” converts the score into behaviour.

INTERACTION

“Why this score?” expands the reasoning. 10 / 30 / 50 wears recalculate the per-wear message. “View Alternatives” continues the loop.

06 EXPANDED RATIONALE

HOW THE SCORE COMMUNICATES

A rating, a reason, and a next step.

The Eco-Score screen is built in three layers, in the order a user actually needs them. First the **verdict**: a large number, a tier word and a colour. Second the **evidence**: the fibre composition and a clearly labelled carbon estimate. Third the **action**: a wear-count selector that reframes the item in terms of cost per wear, and a route to alternatives.

The expandable “Why this score?” panel exists because a score without reasoning invites suspicion. When opened, it states plainly that linen and cotton have different illustrative impact profiles and that the demonstration does not assess a real product. That single sentence does more for credibility than any badge could.

GOOD
78 / 100 · natural fibres

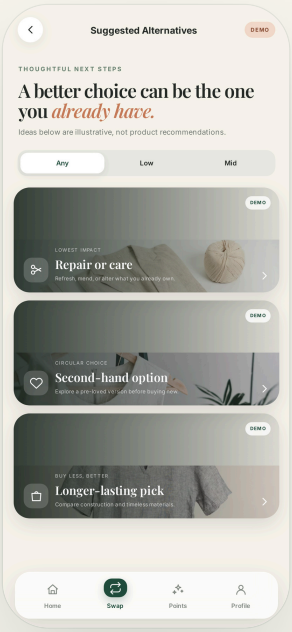

MODERATE
58 / 100 · mixed blend

LIMITED
34 / 100 · synthetic

SCALE
0–100, higher is better

APPLICATION SCREENS · 07–08

Alternatives & GreenPoints

07 SUGGESTED ALTERNATIVES

A kinder next step

LIVE INTERACTION · DEMO DATA

Purpose. Turn a score into a decision. Rather than recommending a specific product to buy, the screen offers three categories of action: repair what you own, buy second-hand, or choose something longer-lasting.

MAIN COMPONENTS

Editorial heading and subline; Any / Low / Mid filter; three image-led cards with a category label, title and one-line explanation.

INTERACTIONS

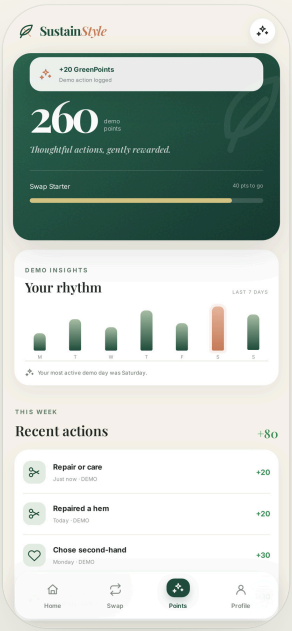

Filters narrow the suggestions. Tapping a card opens a confirmation sheet with “Log this action” and “Maybe later”.

USER ACTIONS

Filter the set, open a suggestion, confirm or dismiss the action.

CONTRIBUTION

Closes the loop between awareness and behaviour — the step most sustainability apps leave out.

08 GREENPOINTS DASHBOARD

My eco impact

LIVE INTERACTION · DEMO POINTS

Purpose. Make progress visible. The dashboard converts small actions into a running total, a weekly rhythm and a badge shelf, so that care feels cumulative rather than invisible.

MAIN COMPONENTS

Gradient points hero with total and “Swap Starter — 60 pts to go”; seven-day activity rhythm; recent actions list with point values; achievement card.

INTERACTIONS

Read-only overview. Points update immediately when an action is logged elsewhere in the app.

USER ACTIONS

Review total, weekly activity, recent entries and badges.

CONTRIBUTION

Provides a reason to return, and reframes sustainability as a personal practice rather than a one-off purchase decision.

ILLUSTRATIVE ACTION SHEET

Choosing “Repair or care” opens a small sheet explaining that logging the action adds sample points. It is a confirmation, not a commitment — “Maybe later” is equally prominent.

STATE CHANGE, NOT DECORATION

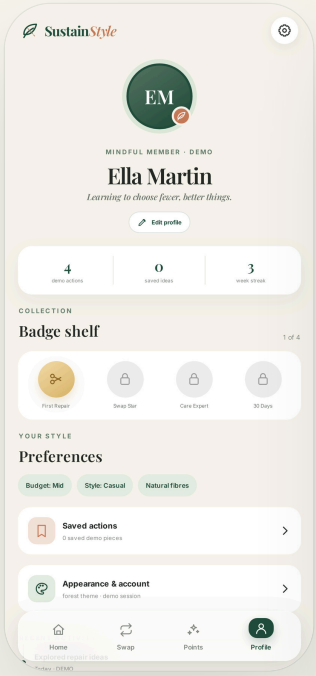

Logging the action moves the total from 240 to 260, adds “+80 Repair or care — Just now”, reduces the distance to the next reward and unlocks the First Repair badge.

HONEST GAMIFICATION

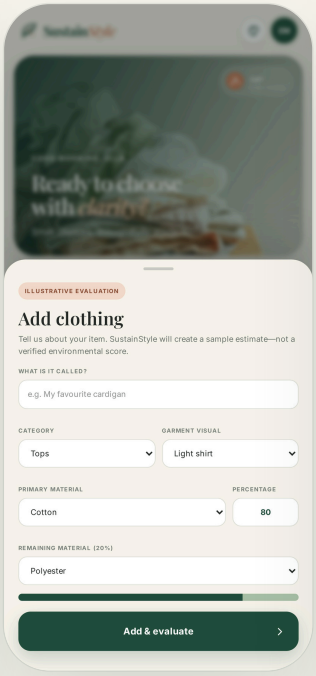

Points are labelled “demo points” and badges are described as illustrative. The mechanic motivates without implying that a real environmental saving has been measured.

APPLICATION SCREENS · 09–11

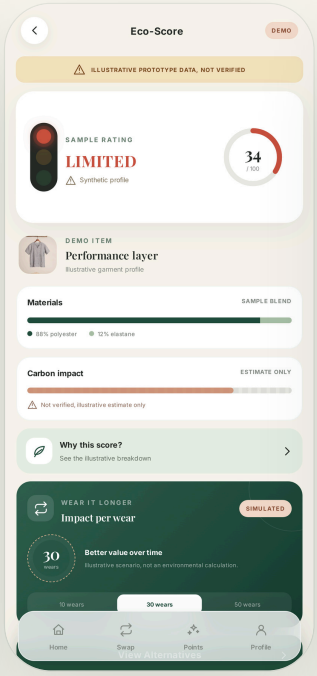

Profile, manual entry & the full rating range

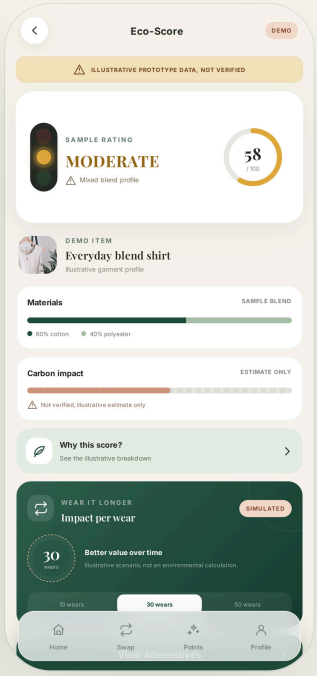

09 PROFILE

10 ADD CLOTHING

11 LIMITED · 34

12 MODERATE · 58

Identity & preferences

Member summary, three demo actions, saved ideas and a three-week streak. A badge shelf shows one unlocked badge out of four: First Repair, Swap Star, Care Expert and 30 Days.

COMPONENTS

Avatar header; stat row; badge shelf; style preferences (budget, style, fibre); saved actions; appearance setting; recent activity.

INTERACTION

“Edit profile” opens an editable sheet with name, bio, budget and style fields plus “Save changes”.

Manual evaluation

For items without a demo code, the user can describe a garment and receive a sample estimate. The sheet states clearly that this is not a verified environmental score.

COMPONENTS

Item name; category; garment visual; primary material; percentage; remaining material; “Add & evaluate”.

INTERACTION

Form entry with select menus, then a generated illustrative score. Dismissible by scrim or escape.

One system, three outcomes

The same template is reused for 34/100 (limited, synthetic) and 58/100 (moderate, mixed blend). Only the colour, tier word and profile label change, so users learn the layout once.

CONSISTENCY

Identical structure across all three tiers reduces the cognitive cost of reading a second or third score.

What the range proves

Showing the weakest outcome next to the strongest is a deliberate choice. A tool that only ever returns a flattering score is not credible, so the limited tier is presented with the same care as the good one.

HONESTY

Red and amber are used for information, never for shame: the copy stays neutral and the next step is always offered.

SCREENS PRESENT IN THE PROTOTYPE

- ✓ Home dashboard
- ✓ Simulated scanning
- ✓ Eco-Score result
- ✓ Suggested alternatives
- ✓ GreenPoints dashboard
- ✓ Edit profile
- ✓ Demo code selection
- ✓ Tag recognised
- ✓ Score explanation
- ✓ Action confirmation
- ✓ Profile
- ✓ Add clothing

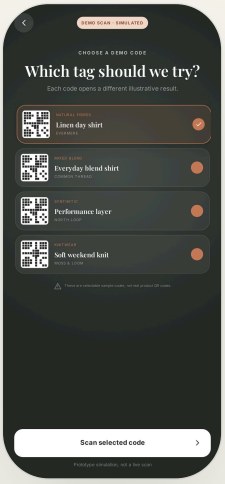

AREAS REQUIRING COMPLETION

The prototype does not yet include a real camera scanner, a live product database, a saved-items collection view, a working resale marketplace, or a settings screen beyond the profile sheet. These are identified as future work rather than presented as finished features.

CORE FEATURE IMPLEMENTATION

Three features, one continuous loop.

The three compulsory features are not separate tools. Each one hands the user to the next: the scanner produces a score, the score produces a recommendation, the recommendation produces points.

A Barcode scanner simulation

SIMULATED

Scanning begins from the primary “Scan an Item” button on Home. Instead of opening a camera, the prototype opens a **demo code** screen offering four sample garment tags: a linen shirt, a cotton–polyester blend, a synthetic performance layer and a knit. The user selects one and taps “Scan selected code”.

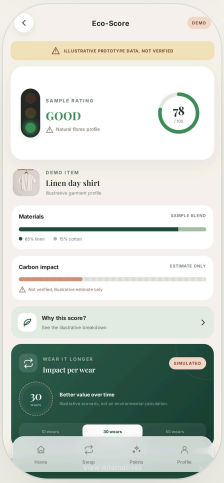

The app then shows a scanning state — “Hold steady · Reading the selected sample tag” — with the brand and fibre composition appearing as if read from the label, followed by a “Tag recognised” confirmation. The primary button adapts its wording to the result: *View good / moderate / limited Eco-Score*.

HOW THE SIMULATION WORKS

Four pre-set records stand in for a product database. A timed delay of roughly three seconds mimics the latency of a real scan, so the interaction has a believable rhythm.

WHY SIMULATE

A real scanner would require camera permissions and a product database. The simulation keeps the prototype testable by anyone, on any device, while making the limitation explicit on screen.

B Eco-Score display

ILLUSTRATIVE DATA

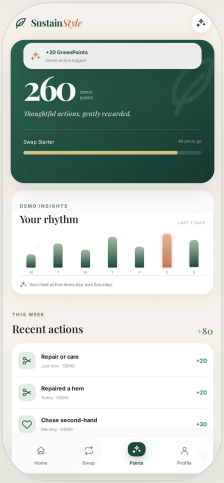

The result screen leads with a large score out of 100, a tier word and a colour. Three tiers are implemented: **Good** (78), **Moderate** (58) and **Limited** (34). Below the rating, two evidence blocks show the material blend and a carbon-impact estimate, both marked as unverified.

A “Why this score?” control expands a short explanation of how the two fibres differ. A “Wear it longer” module then lets the user switch between 10, 30 and 50 wears, changing the message from “Starting point” to “Better value over time”. This is the screen’s most important idea: the environmental cost of a garment is divided by the number of times it is worn.

GOOD
Natural fibres · 78/100

MODERATE
Mixed blend · 58/100

LIMITED
Synthetic · 34/100

C GreenPoints dashboard

DEMO POINTS

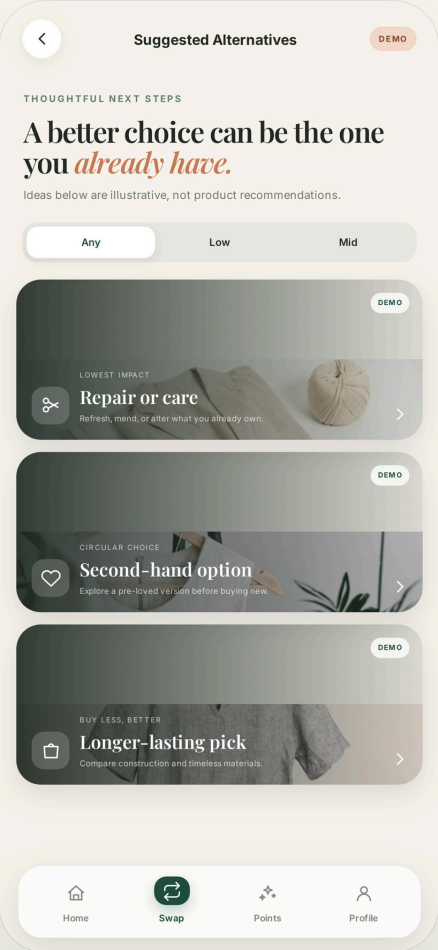

The dashboard shows a total (240 demo points), progress toward the next reward (“Swap Starter — 60 pts to go”), a seven-day activity rhythm, a list of recent actions with their point values, and an achievement card. Actions carry different weights: repairing a hem +60, choosing second-hand +20, comparing three items +30.

The gamification is deliberately gentle. There are no streak penalties, no countdowns and no leaderboards. Badges — First Repair, Swap Star, Care Expert and 30 Days — reward **care and repetition** rather than spending. Logging a repair from the alternatives screen immediately moves the total to 260, adds the new action to the list, shows a “+20 GreenPoints” toast and unlocks the First Repair badge.

Simulated vs verified. Every score, material figure, carbon estimate and point total in this prototype is illustrative. No real product, brand or environmental dataset has been used, and the interface says so on each relevant screen.

ALTERNATIVES & SUSTAINABLE RECOMMENDATIONS

The most sustainable option is often the one you already own.

The alternatives screen exists because a score on its own is a dead end. Knowing that a shirt scores 34 out of 100 does not help anyone if the only next step is to feel bad about it. The screen therefore converts the rating into three concrete routes, each of which is cheaper and lower-impact than buying the original item.

LOWEST IMPACT	**Repair or care.** Refresh, mend or alter what you already own. The lowest-carbon garment is the one already in your wardrobe.
CIRCULAR CHOICE	**Second-hand option.** Explore a pre-loved version before buying new, extending the life of an existing garment.
BUY LESS, BETTER	**Longer-lasting pick.** Compare construction and timeless materials so the next purchase lasts longer.

The filters — Any, Low and Mid — let the user narrow by effort or impact rather than by product category. This was an intentional departure from typical shopping filters: the user is choosing *how* to act, not *what* to buy. Tapping any card opens an action sheet that offers to log the choice, which is what connects this screen to the GreenPoints dashboard.

No real brands, prices or product links are shown. The cards describe categories of behaviour rather than recommending a specific retailer, which keeps the prototype honest and avoids implying partnerships that do not exist.

12 SWAP · SUGGESTED ALTERNATIVES

HOW IT ENCOURAGES CONSCIOUS SHOPPING

By placing a repair option next to a low score, the interface reframes the moment of rejection as a moment of possibility. The user leaves with something to do, not just something to avoid.

HOW USERS EXPLORE

Three large, image-led cards are scannable in a single glance. Filters reduce the set without hiding it, and the action sheet gives a clear exit (“Maybe later”) so nothing feels forced.

WHAT IS MISSING

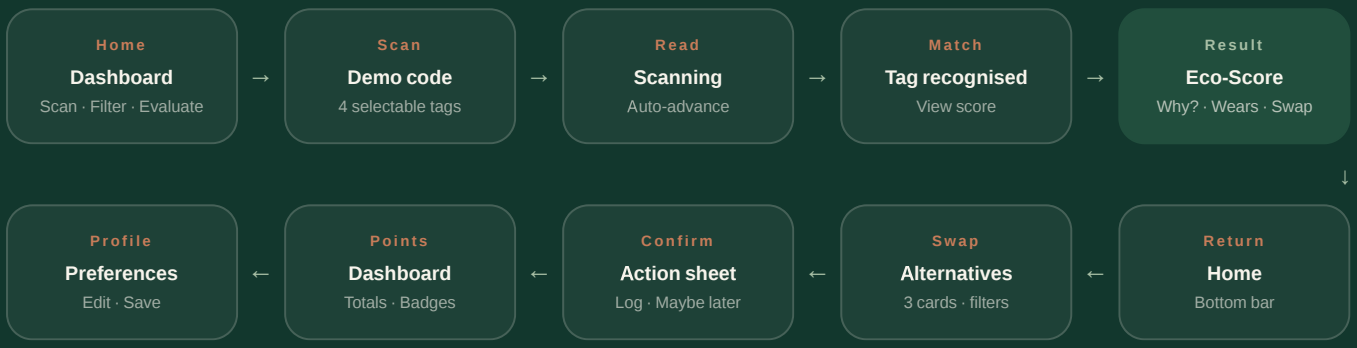

A real recommendation engine, live resale listings and local repair services would be needed before this feature could function outside a prototype.

PROTOTYPE INTERACTIVITY & NAVIGATION

Every screen is a doorway.

The prototype is fully clickable rather than a set of static frames. Navigation is handled by a persistent four-item bottom bar, while each screen also carries its own contextual forward action. The map below was traced by clicking through the live prototype.

PRIMARY INTERACTION MAP

KEY CLICKABLE TARGETS

SCAN AN ITEM	→ Demo code selection
SCAN SELECTED CODE	→ Scanning → Tag recognised
VIEW ... ECO-SCORE	→ Eco-Score result
WHY THIS SCORE?	→ Expands explanation
10 / 30 / 50 WEARS	→ Recalculates message
VIEW ALTERNATIVES	→ Swap screen
LOG THIS ACTION	→ Points total updates

NAVIGATION BEHAVIOUR

The bottom bar — Home, Swap, Points, Profile — is present on every main screen and uses a solid fill plus a small dot to indicate the active section. Secondary screens (scanning, results, alternatives) hide the bar in favour of a clear forward action, which keeps attention on the task.

Back navigation is handled by the browser and by explicit secondary links such as “Choose a different code”. There is no dead end in the prototype: every terminal screen offers either a next step or a route home.

4 NAV DESTINATIONS · 12 SCREENS · NO DEAD ENDS

ONE PRIMARY PATH

The loop is deliberately linear: each screen offers a single obvious forward action, and the escape routes are secondary. A first-time user never has to choose between two equally weighted buttons.

THE BAR DISAPPEARS ON PURPOSE

Scanning and results screens drop the bottom bar. Removing navigation at the moment of decision keeps attention on the score and the recommendation rather than inviting the user to wander away.

EVERY EXIT IS A RETURN

The return chain mirrors the forward chain, so a user who changes their mind can retrace the loop exactly. This symmetry is what makes the prototype safe to explore without instructions.

USABILITY TESTING METHODOLOGY

Watching someone else use it.

STATUS

Testing not yet conducted. This page records the planned method and will be completed with real participant data.

OBJECTIVE

To find out whether a first-time user can complete the core loop — scan, understand a score, find an alternative and log an action — without guidance, and to identify where the interface causes hesitation or confusion.

METHOD

Moderated, task-based usability testing using the live Figma prototype on a phone-sized screen. Each session is observed by the designer, who records completion, time on task and any moments of confusion. Participants are asked to think aloud while working.

PARTICIPANTS

NUMBER	*[INSERT NUMBER]* (minimum two required)
TYPE	*[INSERT PARTICIPANT TYPE]*
AGE RANGE	*[INSERT RANGE]*
DATES	*[INSERT DATES]*

Participants should be representative of the target users described on page 4. No testing has taken place at the time of writing; all fields above remain open.

TASKS GIVEN TO USERS

T1	Open the app and scan a garment without being shown how.
T2	Explain out loud what the Eco-Score means and why the item received it.
T3	Find a lower-impact alternative to the item you just scanned.
T4	Record a thoughtful action and find your updated point total.
T5	Change your budget preference in your profile.

FEEDBACK COLLECTION

Observation notes during the session, followed by a short structured interview using the five questions below. Ratings are collected on a five-point scale. Participants are told that the prototype is a student project and that criticism is more useful than politeness.

EVALUATION CRITERIA

- Task completion (yes / no)
- Time on task
- Number of wrong turns
- Clarity of purpose
- Ease of navigation
- Overall satisfaction (1–5)

POST-TEST QUESTIONS

1. Was the purpose of each screen clear?
2. Was the navigation easy to understand?
3. Was any feature confusing?
4. What would you improve?
5. How would you rate the overall experience?

Ethics note. Participation is voluntary and anonymous. Participants are told the prototype uses simulated data, that no personal information is stored, and that they may stop at any time. Names are replaced with participant codes (P1, P2) in the testing log.

USER TESTING LOG

What happened, in their words.

The table below is prepared for the two required participants. Rows are intentionally blank: no feedback has been invented. Each row should be completed from real observation notes and a short interview.

PARTICIPANT	TASK PERFORMED	FEEDBACK RECEIVED	ISSUE IDENTIFIED	IMPROVEMENT MADE
P1 [Name / code] [Age · profile]	*[e.g. Scanned the synthetic tag and explained the score]*	*[Quote or paraphrase of what P1 said]*	*[Specific usability problem observed]*	*[Change made in response — link to page 16]*
P2 [Name / code] [Age · profile]	*[e.g. Found an alternative and logged the action]*	*[Quote or paraphrase of what P2 said]*	*[Specific usability problem observed]*	*[Change made in response — link to page 16]*
P3 (optional)	*[Task]*	*[Feedback]*	*[Issue]*	*[Improvement]*

FINAL PROTOTYPE & OUTCOME

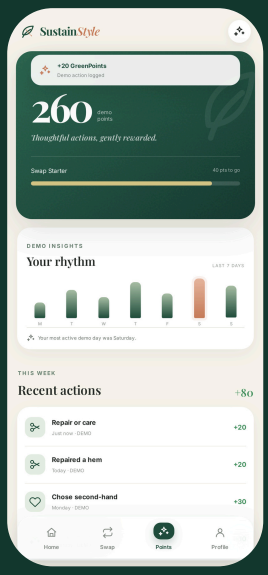

Where the project stands today.

HOME

ECO-SCORE

GREENPOINTS

FEATURES SUCCESSFULLY IMPLEMENTED

- Simulated barcode scan with four selectable sample tags
- Eco-Score with three tiers, materials and carbon estimate
- Expandable score rationale and per-wear comparison
- Alternatives screen with filters and action logging
- GreenPoints dashboard with live total, history and badges
- Profile, editable preferences and manual item entry
- Consistent navigation across all twelve screens

DESIGN STRENGTHS

The strongest part of the prototype is its honesty. Rather than imitating a finished commercial product, it labels every simulated value and explains its own limitations. This makes the design feel mature, and it protects the project from the most common criticism of student sustainability work — claiming more than the evidence supports.

The second strength is restraint. One accent colour, one serif, one primary action per screen. The interface never competes with the message.

CURRENT LIMITATIONS

No live product database or camera scanning. Scores are illustrative, not calculated from real environmental data. Saved items and resale listings are not functional. Testing has not yet been completed.

FUTURE ENHANCEMENTS

A verified fibre database, a real barcode API, a saved capsule wardrobe, local repair partnerships, and a shareable impact summary at the end of each month.

INTERACTION EXPERIENCE

Short, linear and forgiving. Every screen offers a forward action and an exit. The full loop can be completed in well under a minute, which is essential for a tool used while shopping.

OPEN PROTOTYPE

REFLECTION & CONCLUSION

What I learned about designing for a decision.

Before starting SustainStyle, I thought UI/UX design was mostly about making an app look good. Building this prototype taught me that the visual layer is the last thing that happens, not the first. The decisions that changed the product most were not about colour or type — they were about what to leave out. Removing a search bar, a login screen and a checkout made the experience faster and clearer. Designing became an exercise in subtraction.

The hardest part was translating a value — sustainability — into an interface. Values are abstract; screens are specific. I kept asking myself what a user would actually see in the three seconds after scanning a tag. That question produced the structure of the Eco-Score screen: verdict, evidence, action. Once I had that order, the design almost built itself.

Creative thinking played a larger role than I expected, but not in the way I imagined. It was not about inventing something nobody had thought of. It was about reframing a familiar moment. Instead of asking “how do we tell people fashion is damaging?”, I asked “how do we make the better choice the easier one?” That shift produced the alternatives screen and the decision to reward repair rather than purchase. The most creative decision in the project was to make the app recommend that someone buy nothing at all.

Working in Figma taught me the value of a system. Once I had defined the colour tokens, the type scale and the card radii, new screens took a fraction of the time and looked like they belonged together. I also learned that a prototype is a communication tool. A static image explains what a screen looks like; a clickable flow explains what the product *is*.

The biggest challenge was honesty. It would have been easy to present the Eco-Score as a real environmental measurement. It would also have been wrong. Labelling every value as illustrative made the interface busier, but it made the project defensible. I now think that transparency is a design material in its own right — something you can build with, not just a disclaimer you add at the end.

User feedback has not yet been collected, and I have deliberately left those sections of this journal open rather than inventing responses. Writing the testing plan has already changed how I think about the prototype: I can predict where a first-time user might hesitate, particularly around the difference between “Swap” and “Alternatives”, and around whether the demo code screen feels like a real scanner. Those are exactly the questions I want real users to answer.

The most important thing I learned is that user-centred design is not a step at the end of a process. It is a habit of imagination that runs through every decision — trying to see the screen as someone who has never seen it before, who is tired, in a hurry, and not particularly interested in sustainability. If SustainStyle works, it will be because it respects that person rather than lecturing them.

I would like to continue the project by replacing the simulated data with a verified fibre database and by testing with at least five users. But even in its current form, SustainStyle does what I set out to do: it makes the environmental story of a garment visible at the moment a choice is made, and it offers a way forward that feels possible rather than perfect.

> “ Good design does not tell people what to care about. It removes the reasons they had for not caring.

ACKNOWLEDGEMENTS

Thank you to my Critical and Creative Thinking teacher for guidance on the FA-2 brief, and to my classmates who reviewed early versions of the interface and asked useful, awkward questions about the Eco-Score. The prototype was designed and built independently as part of the IBCP Formative Assessment 2.

A NOTE ON DATA

All product names, brands, scores, material percentages, carbon estimates and point totals shown in the prototype are fictional and illustrative. They were created to demonstrate an interaction, not to make an environmental claim about any real product.

DOCUMENT
SustainStyle — UX Design Journal
FA-2: Design. Build. Validate.
Critical and Creative Thinking

PROTOTYPE
Built in Figma / Figma Make
12 interactive screens
Mobile web, 390 px frame

STATUS
Design and build complete
Usability testing pending
Iteration section open
